

*The value of each group is 5p.*

*There are 3 groups.*

$$15p = 3 \times 5p$$

$$15p \div 3 = 5p$$

*Alice can buy 3 bags.*

*Children draw six marshmallows in each bag.*

$$30 \div 5 = 6$$

$$5 \times 6 = 30$$

*Aman is sharing and Jin is grouping. The calculations are the same in terms of numbers but Aman's answer is an amount of money and Jin's answer is a number of coins.*

*Aman:  $50p \div 5 = 10p$*

*Jin:  $50p \div 5 = 10 \text{ coins}$*

*There are 4 possible answers:*

$$15 \div 5 = 3; 5 \times 3 = 15$$

$$25 \div 5 = 5; 5 \times 5 = 25$$

$$35 \div 5 = 7; 5 \times 7 = 35$$

$$45 \div 5 = 9; 5 \times 9 = 45$$

*Higher numbers would require 2 cards in the answer which cannot be done with only one space available.*
