

Khalid began by subtracting the number of apples at the beginning of the day from the number of apples sold. The answer of 68 is then the number of the apples delivered that day that were sold, so the answer would come from  $144 - 68 = 76$ .

Another way would be to add the number of apples at the beginning of the day to the apples delivered:  $239 + 144 = 383$ .

Then subtract the number sold from this total:  $383 - 307 = 76$

Alisha is correct:  $£18.35 + £5 - £7.99 - £13.49$

Jack is incorrect:  $£7.99 + £13.49 - £18.35$ . He has missed out the £5 pocket money and subtracted the money in the purse from the amount spent.
